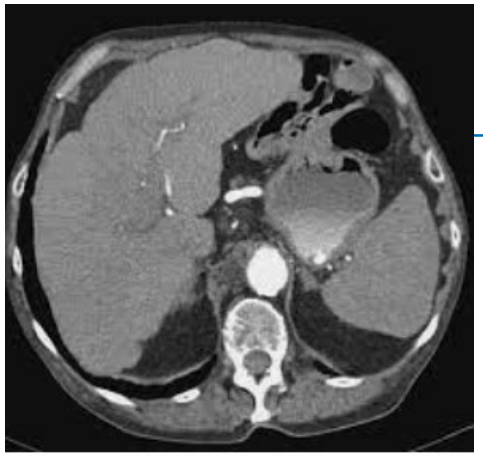
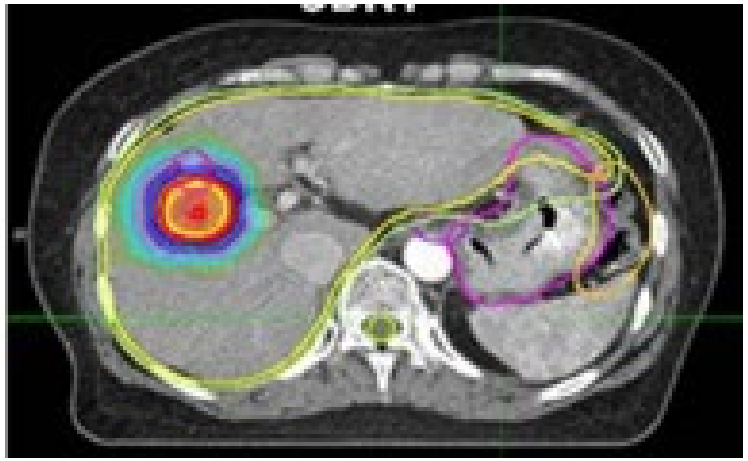
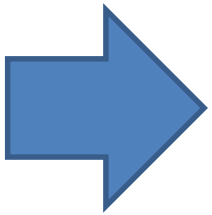
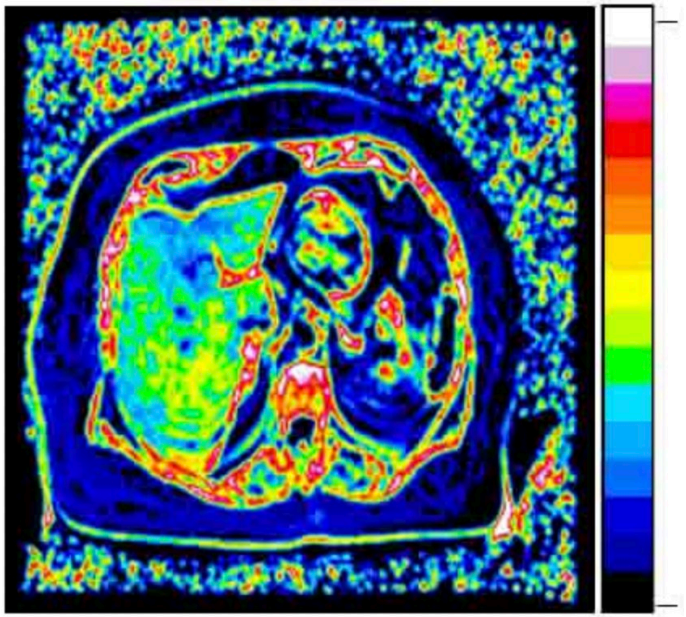
KI-basierte Imaging Features

"It is only with the heart
that one can see rightly;
what is essential is invisible
to the eye."



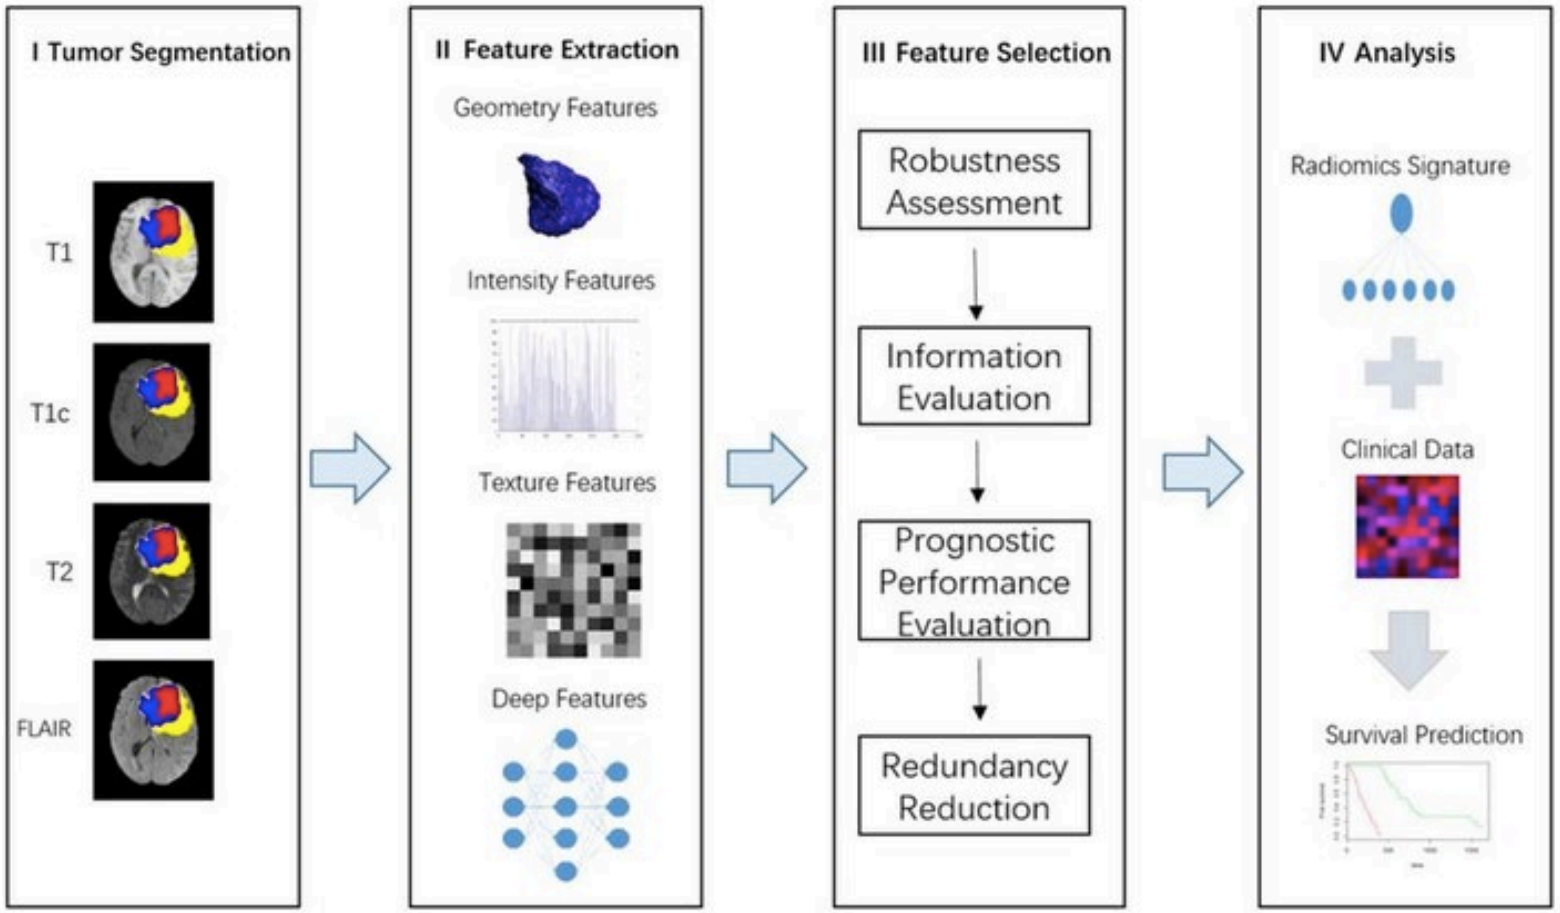






„Functional Liver Mapping“

Etablierte Radiomics Pipeline



1. Identifikation der Patienten
2. Multimodale Therapie
3. Dosis-Wirkungs Beziehung
4. Translationales/ Radiologisches Begleitprojekt zu KI

Studienziel:

1. Bewertung der Rolle der SBRT für die Behandlung vom HCC

2. Optimierung der Empfehlungen zur SBRT in künftigen prospektiven Studien und Leitlinien, um hohe Tumorkontrollraten zu erreichen und die Strahlentoxizität bei Patienten mit Leberzirrhose zu verringern

Zur Beantwortung dieser wichtigen Fragen:

Register für SBRT beim HCC

Studienziele:

1. **Rückfallanalyse** (Muster des Rückfalls) Im Rahmen dieser Studie soll das lokale Rezidivmuster analysiert werden, um Zusammenhänge zwischen Dosis und dem Auftreten von Rezidiven zu identifizieren.

2. **Multimodale Therapie** bewerten?

3. Bewertung der onkologischen Endpunkte und strahlentherapiebedingter Toxizität

4. Untersuchung von FU-Bildgebung, Radiomics und Deep Learning

Studienteilnehmer:

Patienten mit nicht-metastasiertem HCC, die mit SBRT behandelt wurden

Einschlusskriterien:

- Behandlung von HCC mit SBRT
- Frauen und Männer, die mindestens 18 Jahre alt sind

n= 250 im retrospektiven Teil der Studie (HepReg I)
n= 150
